/Duane S. Smith/			
Supervisory Patent Examiner, Art Unit 1797 4-30-08			

Continuation of 11. does NOT place the application in condition for allowance because: The present Amendments and present Remarks do not overcome the Final rejections for the following reasons: 1) argument concerning that the batch-wise method of Saito et al (US06716942B1) does not disclose this characteristic feature of the invention - at least 8 g per liter of the capacity of reaction vessel in a steady state, Saito et al (US06716942B1) disclose the polymerization to be carried out by any of batchwise, semi-batchwise and continuous methods (Col. 7, line 27-29), the size, capacity of the reactor as claimed by applicants would be an optimization unless applicants provide the criticality. 2) argument concerning that the temperature does not exceed Tc of HFP and pressure does not exceed Pc of VdF in the Examples, applicants respectfully disagree with the Examiner's position, in review the Example 1 of Saito et al (US06716942B1), it recites: the pressure and temperature in the polymerization reaction field were 5.13 Mpa and 120 degree C., respectively, the formed reaction field was in a supercritical state (Col. 10, line 51-63). The pressure of 5.13 Mpa is greater than both Pc of HFP and VdF monomers, the temperature of 120 degree C is greater than Tc of both HFP and VdF monomers. Therefore, the ratio of monomer density not lower than 1.1 is possessed inherently by invention of Saito et al (US06716942B1).
